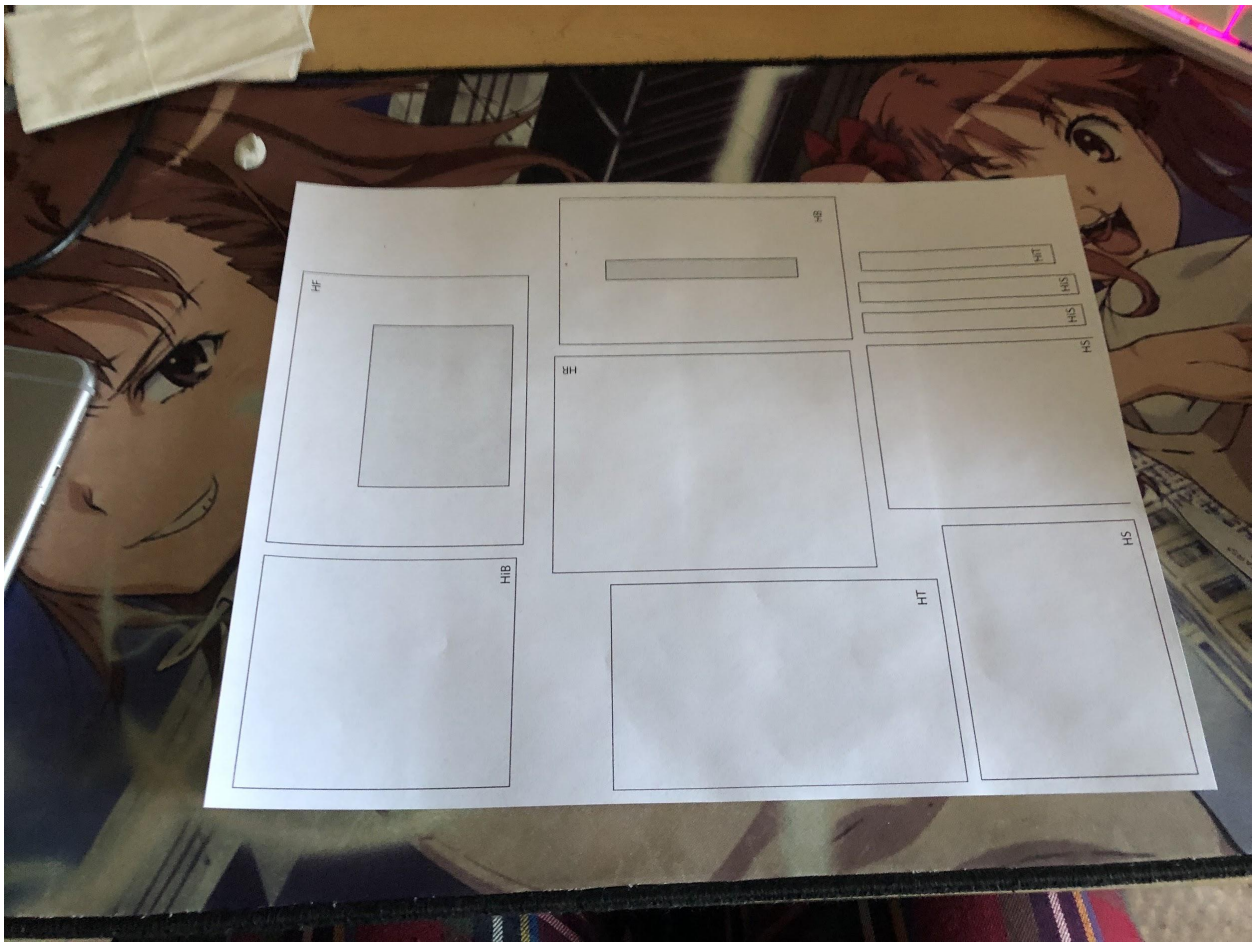
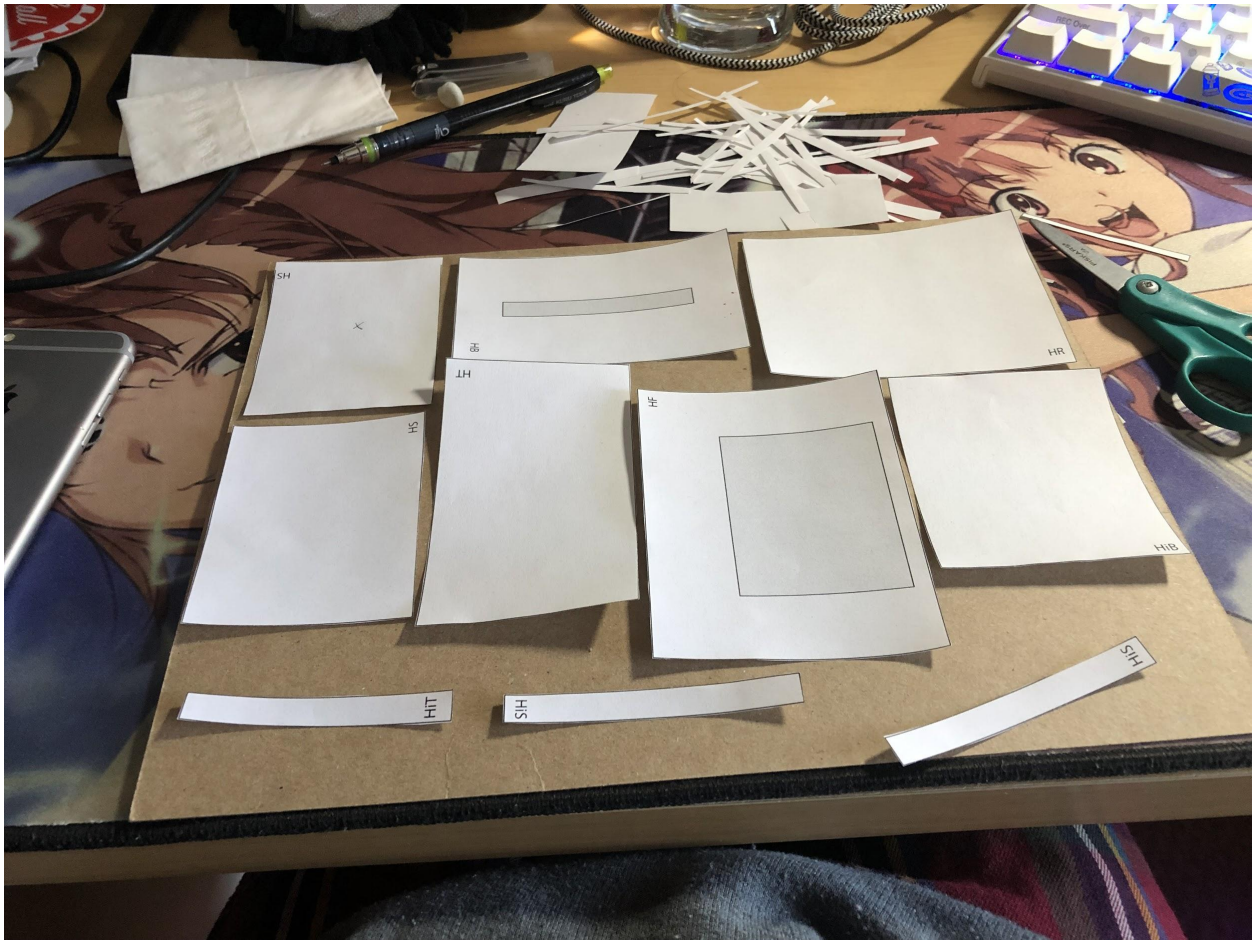
Construction Usabo



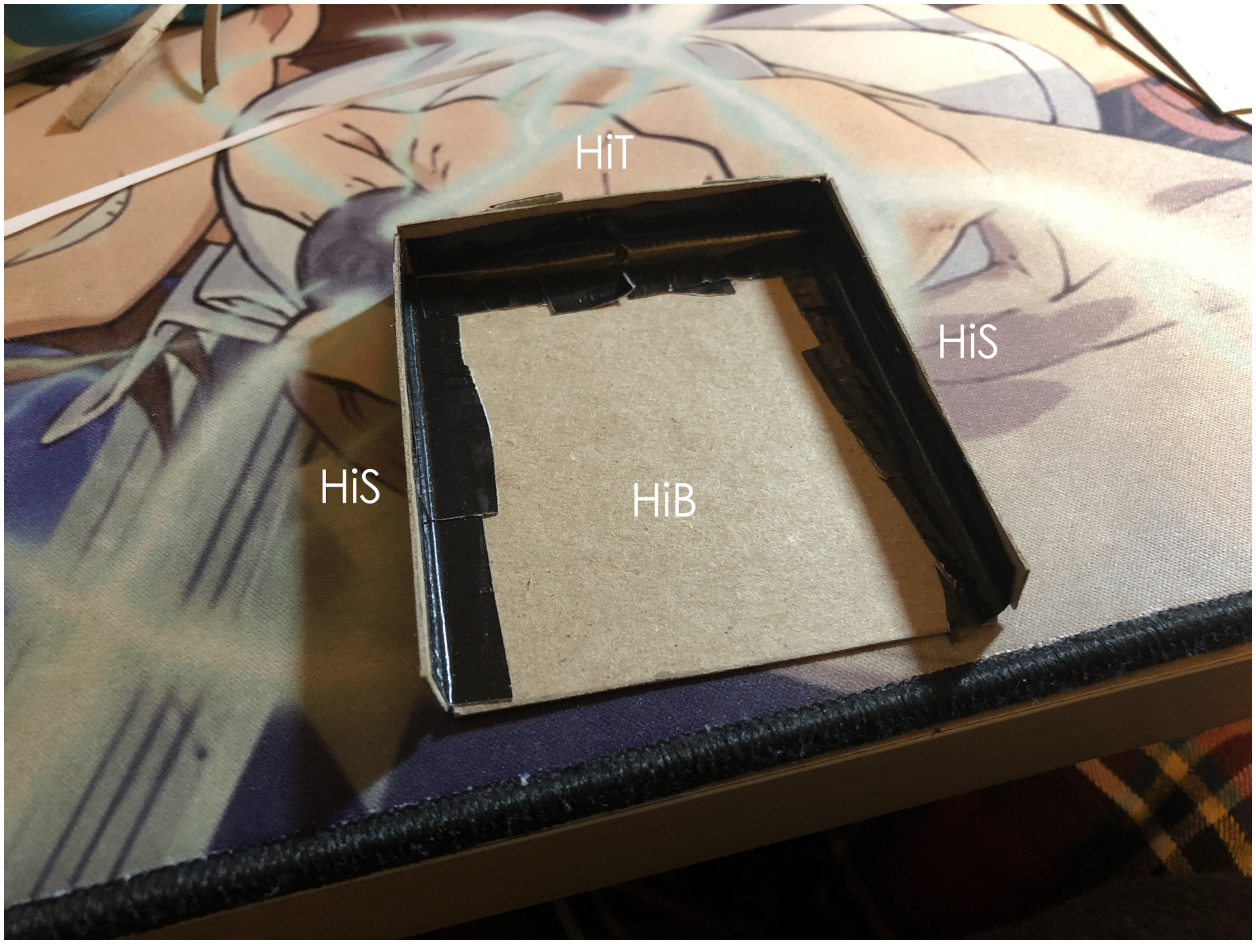
1. Print out your sheets!



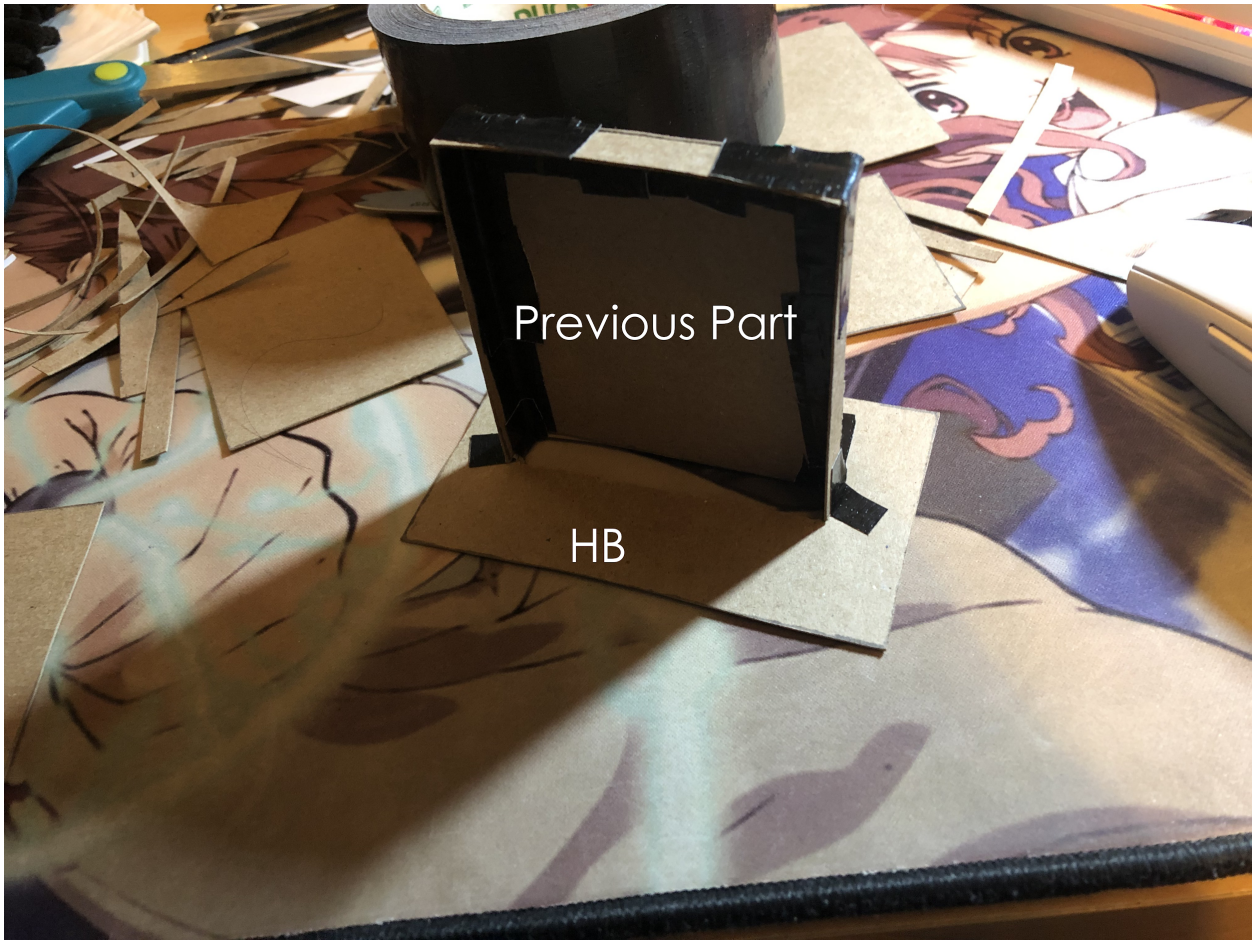
2. Cut out the shapes on the sheets and lay it out on to the cardboard (note for the shapes with grey inner sections, you alway so need to those grey sections)

3. Trace the paper sheets onto the cardboard and cut out the cardboard

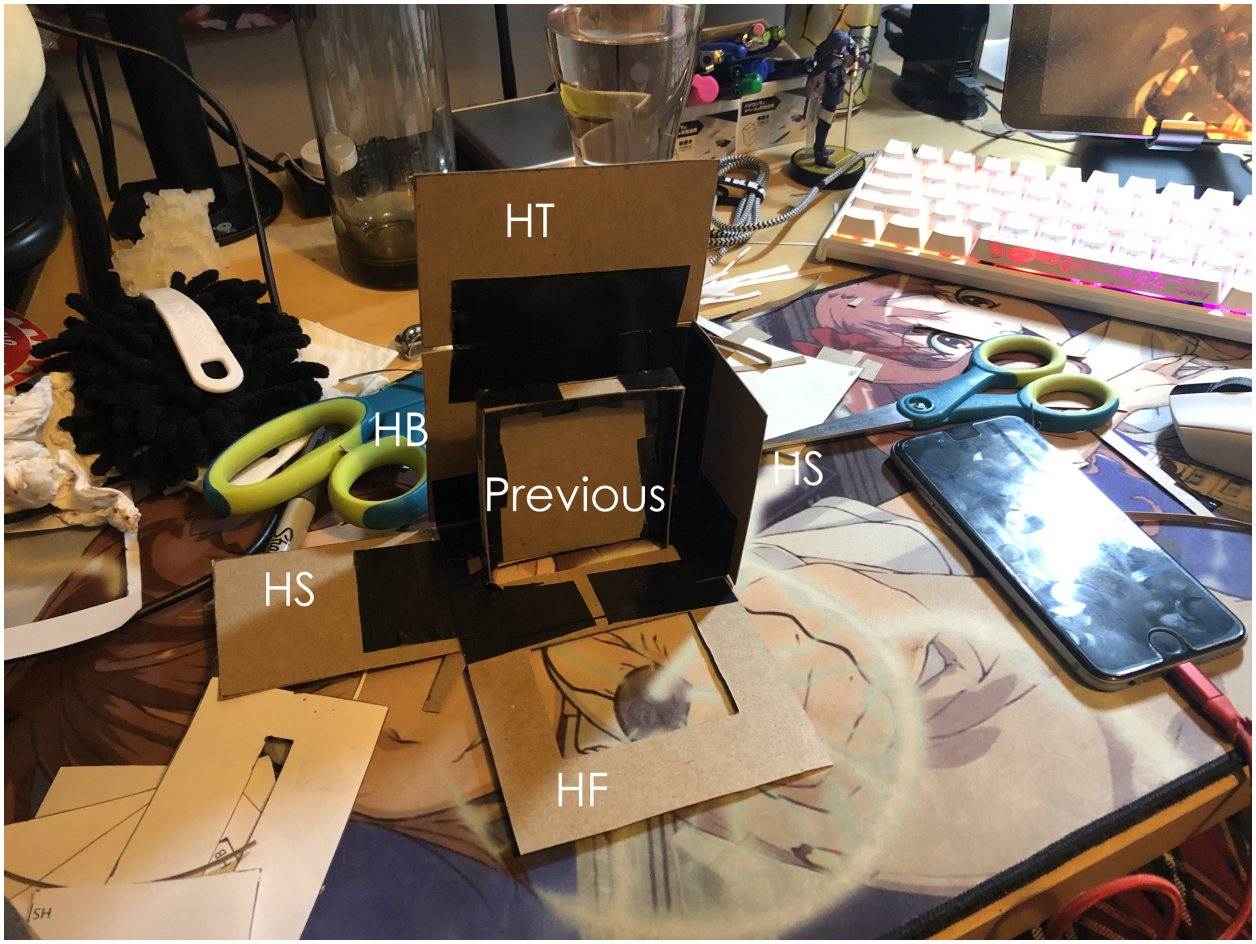
(Optional) Cheat and use a Cricut instead of doing it by hand



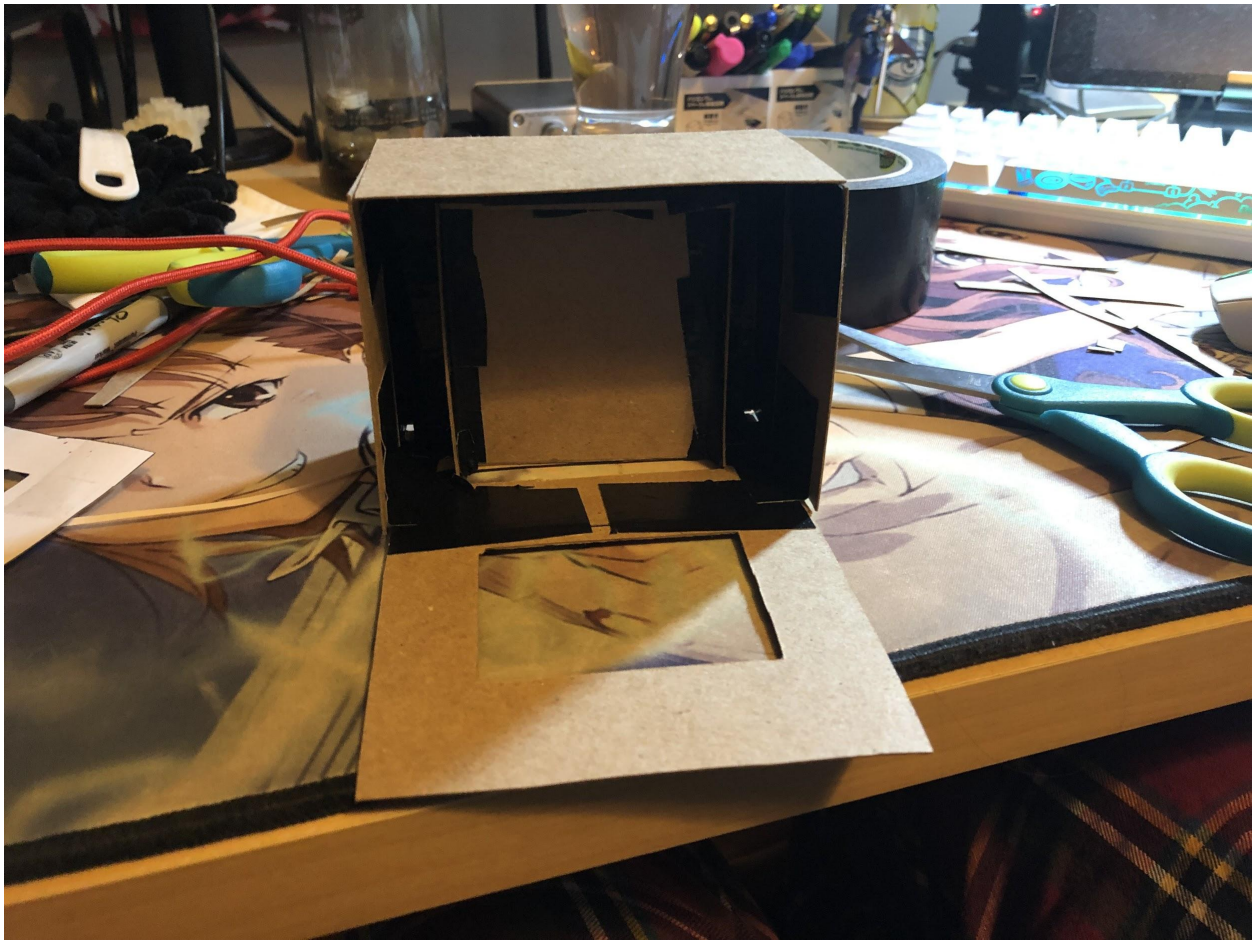
4. Finally on to the building, The first thing we'll construct is the inner portion of the head. This is where the phone will rest inside of the head. So build a half box with the list parts.



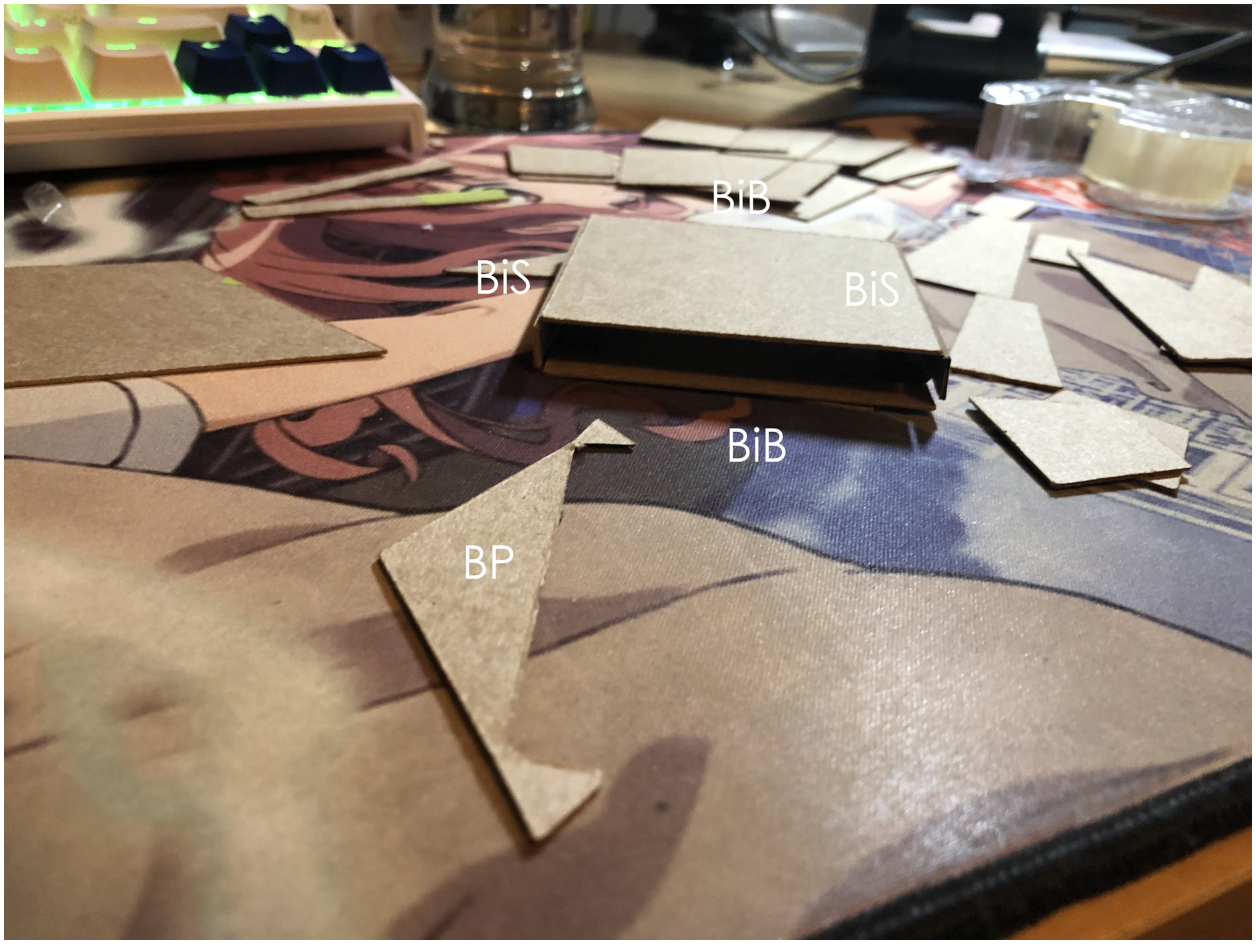
5. Next we want to place the part we just made on top of the bottom plate. Make sure that the frame matches up with the hole in the bottom plate so that a phone can go in and out.



6. Now we can take the rest of the head and just build a box around the bottom plate. Just make sure that open side of the inner frame is on the same side as HF so that the phone screen would be pointed out the hole.

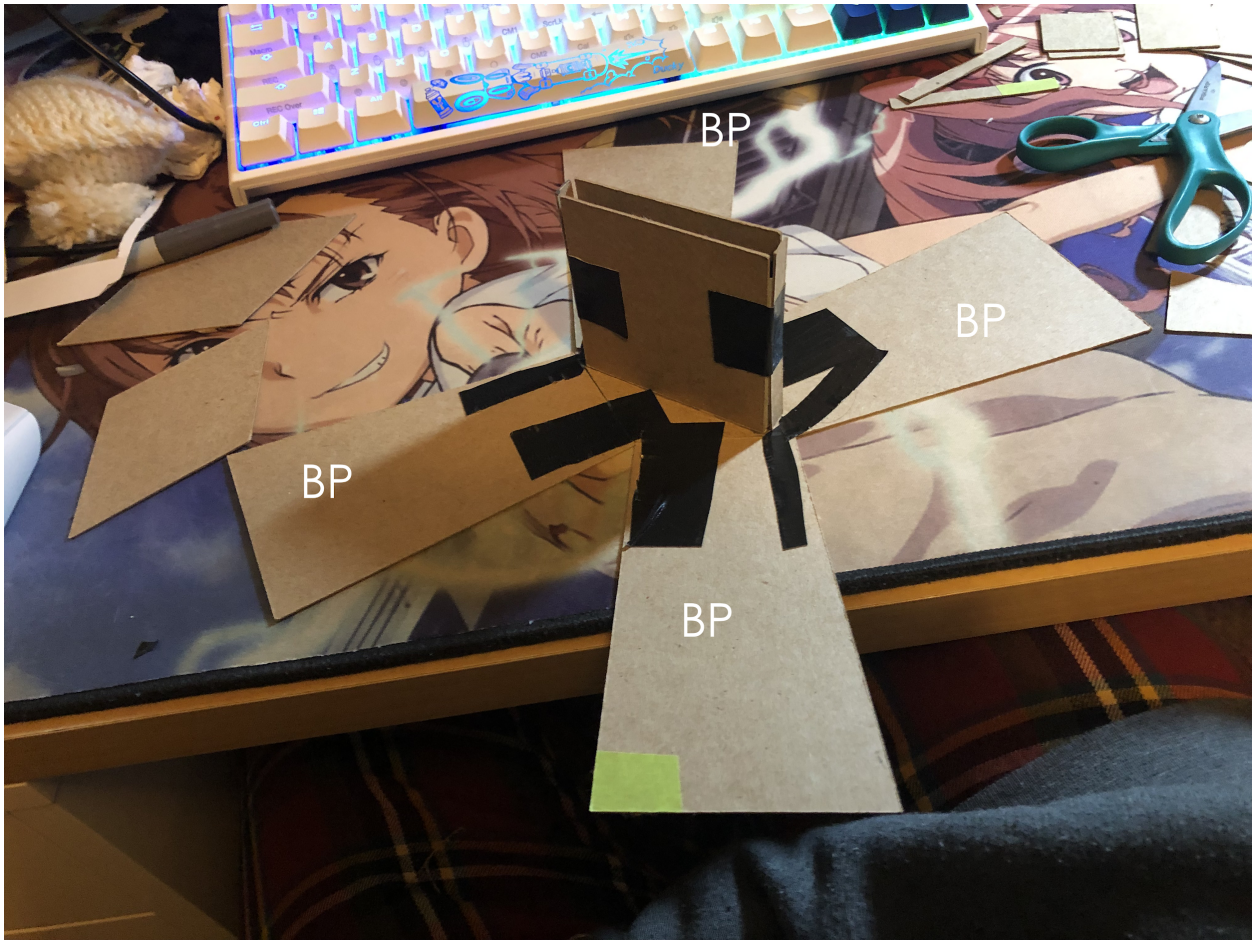


7. Make sure to leave the front till last so that you can use the hole as space to access the inside



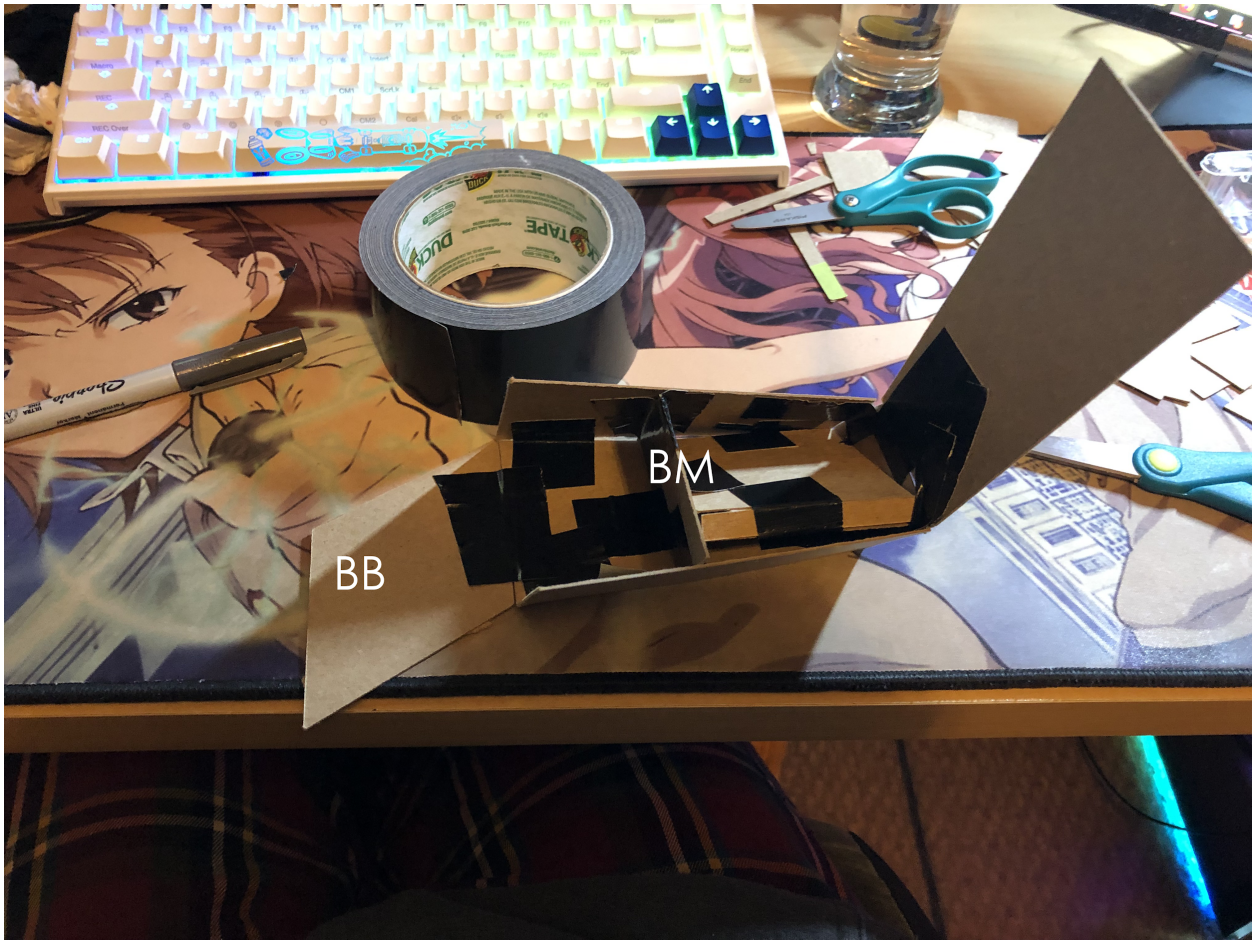
8. Whoops missed a photo here, but there's two things going on. First all we do is build a box with an open top and bottom out of 2x BiS and 2x BiB. I recommend just laying them out flat, tapping them together and then wrapping it up to tape the last side. Second you can see that I broke BP, but that's really no problem cause we'll fix it in the next step.

9. Now we can just adfix the hole of BP to one side of the part we just made. If you torn BP like I did, just add more tape than normal and you should be good.



10. Now let's attach the side panels to BP (also I accidentally named them the same, whoops, although it should be obvious that the large panels labeled BP that there are 4 of are the side panels).. With the side panels, make sure that you're attaching the short ends to the piece we just make and place the straight edge on the middle (ie the point where the box has it's long edge).

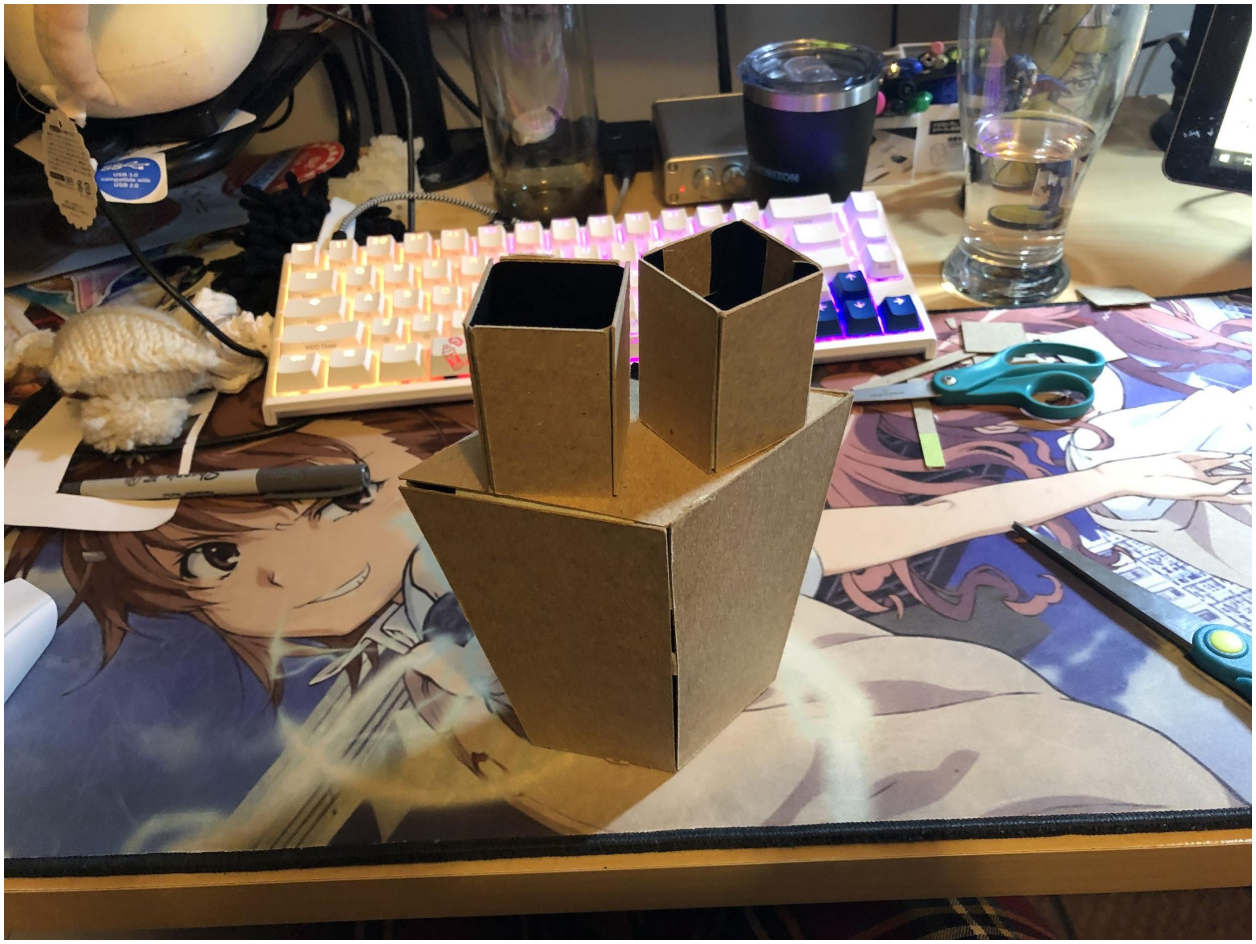
11. Now you want to fold up two of the sides and tape them



12. Now there’s a lot going on. First, fold up and a tape a third side. Next you want to place BM on top of the inner box, so it’s press right up to it. Tape it in place. Finally attach BB to on of the side panels, making sure that it’s the right side

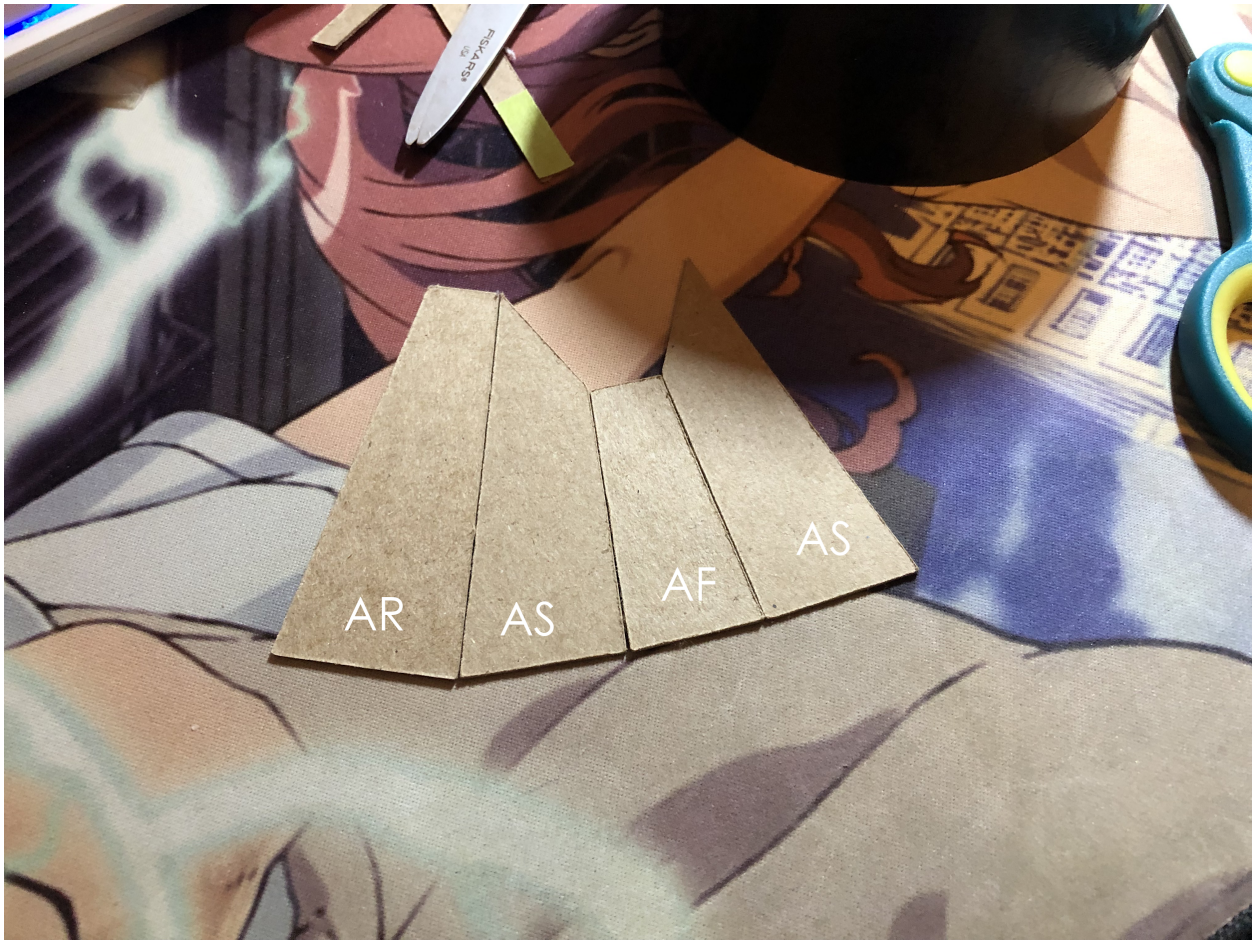
13. Now just fold everything up and tape it together and you have the body! (Easier said than done)

4x L

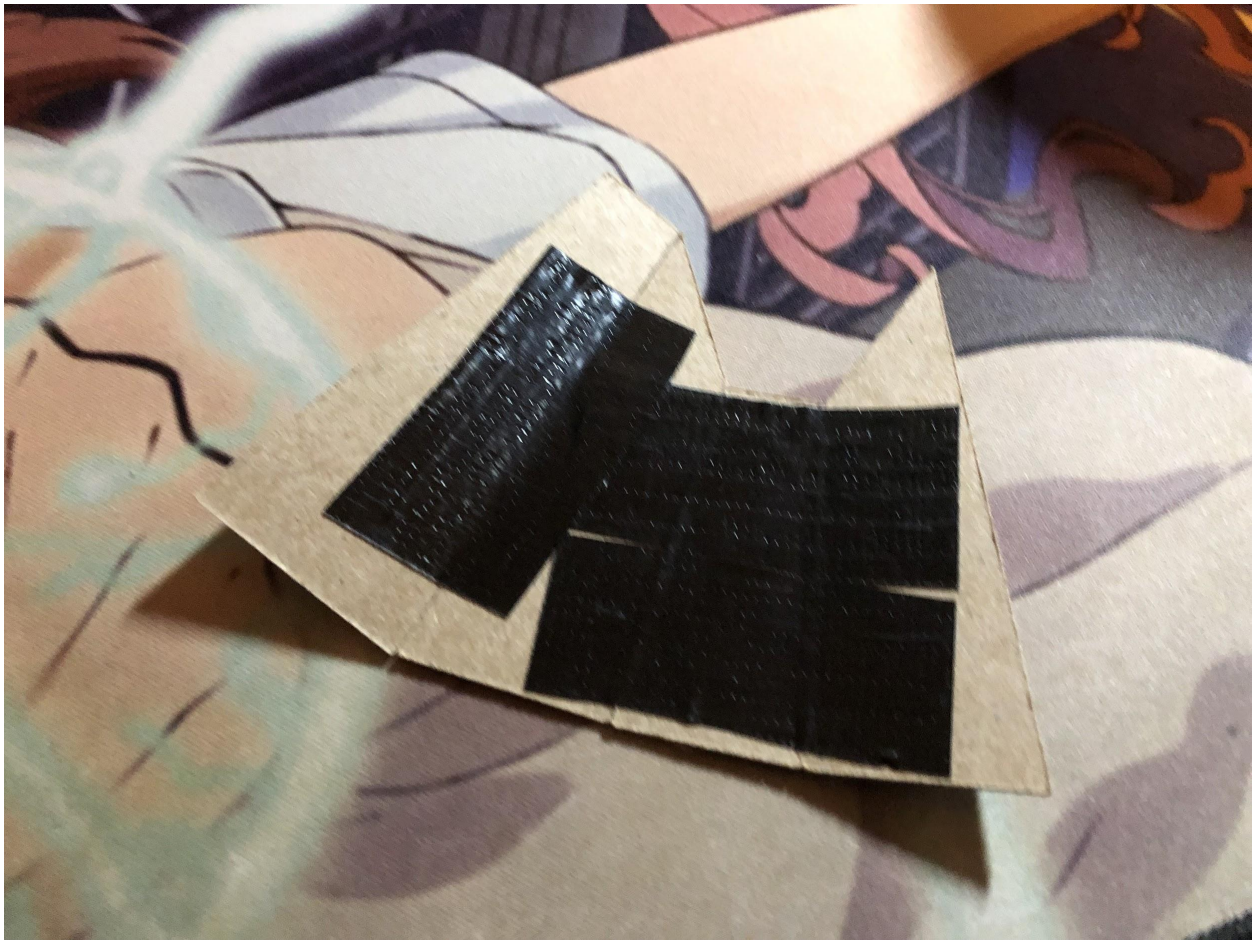


14. Now take 4 L pieces parts side by side, tape them up and then finally roll them up (taping them along the way) and you have yourself the legs. (They’re just tubes honestly). Repeat twice for both legs.

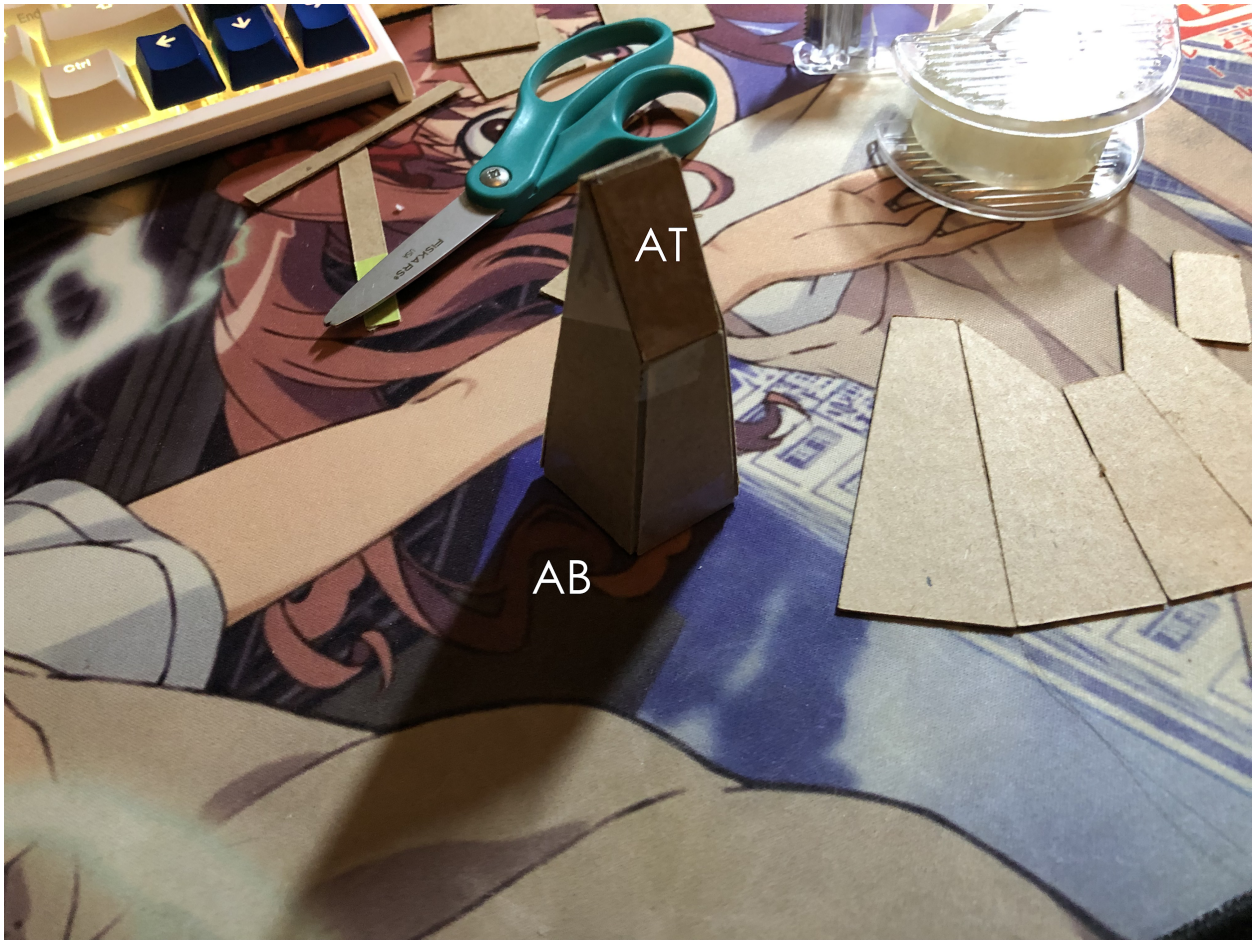
15. Adfix to the body however you like, but I personally just made a tape nest on the inside and stuck it on



AR
AS
AF
AS

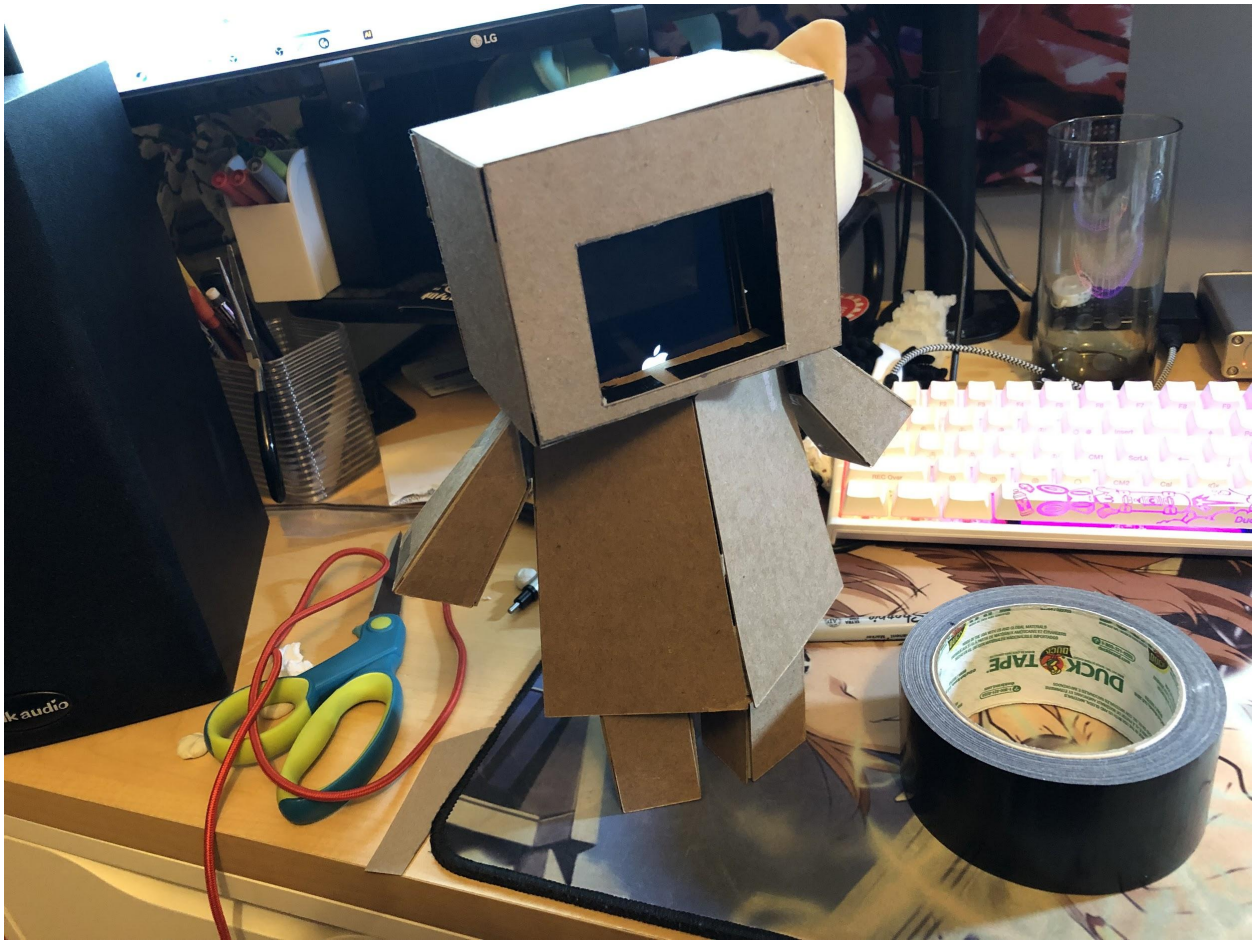


16. The arms are just more of the same as the legs, just this time you have to be careful the order and direction of the parts (pay attention to the photos!). Repeat twice again for both arms.



17. Attach AT to the top of the arm (narrow) and AB to the bottom (wide)

18. Last step is adfix in the arms. You can do this however you like, I personally just taped them on



19. And you’re done with your own personal Usabo!
